this textbook addresses the key questions in both classical thermodynamics and statistical thermodynamics why are the thermodynamic properties of a nano sized system different from those of a macroscopic system of the same substance why and how is entropy defined in thermodynamics and how is the entropy change calculated when dissipative heat is involved what is an ensemble and why is its theory so successful translated from a highly successful chinese book this expanded english edition contains many updated sections and several new ones they include the introduction of the grand canonical ensemble the grand partition function and its application to ideal quantum gases a discussion of the mean field theory of the ising model and the phenomenon of ferromagnetism as well as a more detailed discussion of ideal quantum gases near $t = 0$ for both fermi and bose gases book jacket

using an applications perspective thermodynamic models for industrial applications provides a unified framework for the development of various thermodynamic models ranging from the classical models to some of the most advanced ones among these are the cubic plus association equation of state cpa eos and the perturbed chain statistical association fluid theory pc saft these two advanced models are already in widespread use in industry and academia especially within the oil and gas chemical and polymer industries presenting both classical models such as the cubic equations of state and more advanced models such as the cpa this book provides the critical starting point for choosing the most appropriate calculation method for accurate process simulations written by two of the developers of these models thermodynamic models for industrial applications emphasizes model selection and model development and includes a useful which model for which application guide it also covers industrial requirements as well as discusses the challenges of thermodynamics in the 21st century
